CLEAN WITH  
PAVER PREP FIRST  
FOR A SUCCESSFUL  
SEALER  
APPLICATION

Protect and beautify  
your installations

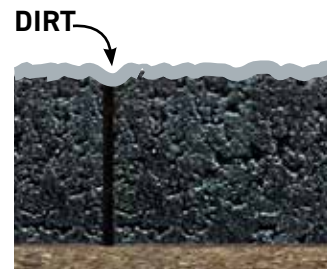

## WHY USE PAVER PREP

### You wouldn't paint or wax a dirty, dusty car, would you?

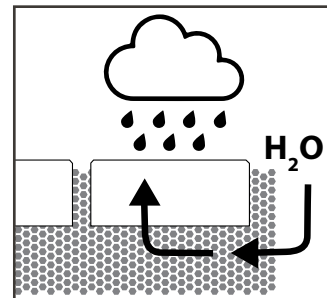

The same principle applies to pavers. Sealing without cleaning will not only seal impurities onto the pavers, but will also weaken the adherence power of the sealer.

We recommend using Techniseal Paver Prep to remove impurities from the surface of pavers prior to sealing.

The surface pores of pavers are often clogged with impurities (ground-in dirt, soil, dust and mineral salts).

A surface that has not been properly cleaned prior to sealing will diminish the adherence and/or penetration of the sealer to the pavers.

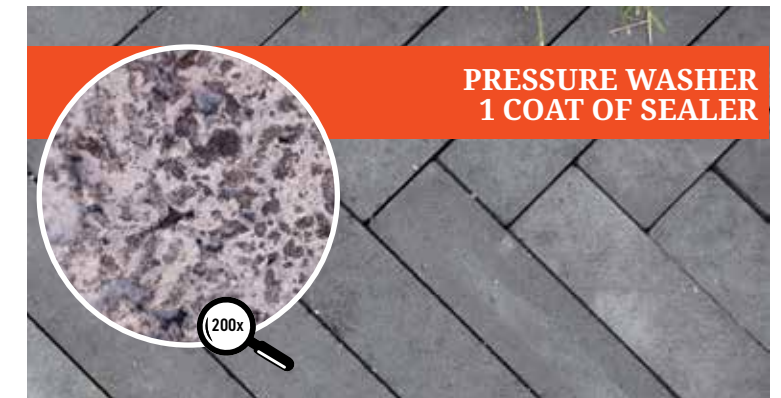

As water evaporates after a rainfall, mineral salts will be brought to the surface. These minerals will mix with the other contaminants to create a barrier that will inhibit a sealer from adhering to the surface of the pavers.

## WHY USE PAVER PREP VS PRESSURE WASHING ONLY

Efflorescence as seen under a microscope at 200x magnification. (showing as pale shades in magnified insets).

### BECAUSE PAVER PREP REMOVES EFFLORESCENCE

Regular pressure washing can only help remove some ground-in dirt and impurities.

**Techniseal Paver Prep is the ONLY solution to completely remove both dirt and minerals from the surface of pavers.**
